

### 1 - 14 Gauss elimination

Solve the linear system given explicitly or by its augmented matrix.

$$\begin{aligned} 1. \quad & 4x - 6y = -11 \\ & -3x + 8y = 10 \end{aligned}$$

```
Clear["Global`*"]
```

```
Solve[4 x - 6 y == -11 && -3 x + 8 y == 10]
```

$$\left\{ \left\{ x \rightarrow -2, y \rightarrow \frac{1}{2} \right\} \right\}$$

The green cell above agrees with the text answer.

$$3. \quad x + y - z = 9, 8y + 6z = -6, -2x + 4y - 6z = 40$$

```
Clear["Global`*"]
```

```
Solve[x + y - z == 9 && 8 y + 6 z == -6 && -2 x + 4 y - 6 z == 40]
```

$$\left\{ \left\{ x \rightarrow 1, y \rightarrow 3, z \rightarrow -5 \right\} \right\}$$

The green cell above agrees with the text answer.

$$5. \quad \begin{pmatrix} 13 & 12 & -6 \\ -4 & 7 & -73 \\ 11 & -13 & 157 \end{pmatrix}$$

```
{{65., 60., -30.}, {-20., 35., -365.}, {55., -65., 785.}}
```

```
Clear["Global`*"]
```

```
Solve[
  13 x + 12 y + -6 z == 0 && -4 x + 7 y - 73 z == 0 && 11 x - 13 y + 157 z == 0, {x, y}]
{{x -> -6 z, y -> 7 z}}
```

$$A = \begin{pmatrix} 13 & 12 & -6 \\ -4 & 7 & -73 \\ 11 & -13 & 157 \end{pmatrix}$$

```
{{13, 12, -6}, {-4, 7, -73}, {11, -13, 157}}
```

```
RowReduce[A]
```

```
{{1, 0, 6}, {0, 1, -7}, {0, 0, 0}}
```

Above: It is seen from inspection that  $x = 6$  and  $y = -7$ , the same values found in the text.

$$7. \begin{pmatrix} 2 & 4 & 1 & 0 \\ -1 & 1 & -2 & 0 \\ 4 & 0 & 6 & 0 \end{pmatrix}$$

```
{{14., 28., 7., 0.}, {-7., 7., -14., 0.}, {28., 0., 42., 0.}}
```

```
Clear["Global`*"]
```

$$A = \begin{pmatrix} 2 & 4 & 1 & 0 \\ -1 & 1 & -2 & 0 \\ 4 & 0 & 6 & 0 \end{pmatrix}$$

```
{{2, 4, 1, 0}, {-1, 1, -2, 0}, {4, 0, 6, 0}}
```

```
e1 = RowReduce[A] // MatrixForm
```

$$\begin{pmatrix} 1 & 0 & \frac{3}{2} & 0 \\ 0 & 1 & -\frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

```
Solve[x + \frac{3}{2} z == 0 && y - \frac{1}{2} z == 0, {x, z}]
```

```
{{x -> -3 y, z -> 2 y}}
```

Above: The text sets  $y = t$ , but this is not necessary. Either one is arbitrary in value. To accord with text,  $x = -3t$ ,  $z = 2t$ .

$$9. \begin{pmatrix} 0 & -2 & -2 & -8 \\ 3 & 4 & -5 & 13 \end{pmatrix}$$

```
{{0., -18., -18., -72.}, {27., 36., -45., 117.}}
```

```
Clear["Global`*"]
```

```
Solve[-2 y - 2 z == -8 && 3 x + 4 y - 5 z == 13, {x, y}]
```

```
{{x -> -1 + 3 z, y -> 4 - z}}
```

Above: The answer agrees with text, provided a parameter  $t$  is invented such that  $z = t$ .

$$11. \begin{pmatrix} 0 & 5 & 5 & -10 & 0 \\ 2 & -3 & -3 & 6 & 2 \\ 4 & 1 & 1 & -2 & 4 \end{pmatrix}$$

```
{{0., 55., 55., -110., 0.},  
{22., -33., -33., 66., 22.}, {44., 11., 11., -22., 44.}}
```

I think there may be something wrong with this problem, or with my procedure of solving.

```
Clear["Global`*"]
```

$$A = \begin{pmatrix} 0 & 5 & 5 & -10 & 0 \\ 2 & -3 & -3 & 6 & 2 \\ 4 & 1 & 1 & -2 & 4 \end{pmatrix}$$

```
{ {0, 5, 5, -10, 0}, {2, -3, -3, 6, 2}, {4, 1, 1, -2, 4} }
```

The row reduction comes up with a null row. Is that an ominous sign?

```
e1 = RowReduce[A]
```

```
{ {1, 0, 0, 0, 1}, {0, 1, 1, -2, 0}, {0, 0, 0, 0, 0} }
```

The dot product has fewer equation seeds than there are rows in the A matrix. I play around with the assigned positions and signs of t1 and t2 to try to come up with the text answer.

```
e2 = e1.{x, y, z, t2, -t1}
```

```
{ -t1 + x, -2 t2 + y + z, 0 }
```

```
Solve[-t1 + x == 0 && -2 t2 + y + z == 0, {x, y}]
```

```
{ {x -> t1, y -> 2 t2 - z} }
```

Let me trot out the text answer:  $x = t_1$  arb.;  $y = 2t_2 - t_1$ ;  $z = t_2$  arb. So playing with the text answer, I find the equation  $y = 2z - x$ . If I adopt the stance that  $z = t_2$ , then I can make the same equation out of the results above, that is  $y = 2z - x$ . So I will tentatively take a green.

$$13. \begin{pmatrix} 0 & 10 & 4 & -2 & -4 \\ -3 & -17 & 1 & 2 & 2 \\ 1 & 1 & 1 & 0 & 6 \\ 8 & -34 & 16 & -10 & 4 \end{pmatrix}$$

```
{ {0., 130., 52., -26., -52.}, {-39., -221., 13., 26., 26.},  
  {13., 13., 13., 0., 78.}, {104., -442., 208., -130., 52.} }
```

```
Clear["Global`*"]
```

$$e1 = \begin{pmatrix} 0 & 10 & 4 & -2 & -4 \\ -3 & -17 & 1 & 2 & 2 \\ 1 & 1 & 1 & 0 & 6 \\ 8 & -34 & 16 & -10 & 4 \end{pmatrix}$$

```
{ {0, 10, 4, -2, -4}, {-3, -17, 1, 2, 2},  
  {1, 1, 1, 0, 6}, {8, -34, 16, -10, 4} }
```

```
e2 = RowReduce[e1]
```

```
{ {1, 0, 0, 0, 4}, {0, 1, 0, 0, 0}, {0, 0, 1, 0, 2}, {0, 0, 0, 1, 6} }
```

```
e3 = e2.{w, x, y, z, t1}
```

```
{ 4 t1 + w, x, 2 t1 + y, 6 t1 + z }
```

```
e4 = Solve[4 t1 + w == 0 && 2 t1 + y == 0 && 6 t1 + z == 0 && x == 0]  
{ {w → -4 t1, x → 0, y → -2 t1, z → -6 t1} }  
  
e5 = e4 /. t1 → -1  
  
{ {w → 4, x → 0, y → 2, z → 6} }
```

Above: The answer matches the text.
