

Note: In this problem set, expressions in green cells match corresponding expressions in the text answers.

1 - 10 Line integrals: evaluation by Green's theorem

Evaluate $\int_C \mathbf{F}(\mathbf{r}) \cdot d\mathbf{r}$ counterclockwise around the boundary C of the region R by Green's theorem, where

$$1. \mathbf{F} = \{y, -x\}, \quad C \text{ the circle } x^2 + y^2 = \frac{1}{4}$$

Note: Rogawski has an example which I followed in form.

$$\begin{aligned} P[x, y] &= y \\ Q[x, y] &= -x \\ y \\ -x \end{aligned}$$

Inspect the derivative set to judge continuity

$$\begin{aligned} D[P[x, y], x] \\ D[P[x, y], y] \\ D[Q[x, y], x] \\ D[Q[x, y], y] \\ 0 \\ 1 \\ -1 \\ 0 \end{aligned}$$

All of the above derivatives are definitely continuous inside the path, so Green's should apply.

$$\int_0^{2\pi} \int_0^{1/8} (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx$$

$$-\frac{\pi}{2}$$

The above answer matches the text. I had trouble with the limits of the integrals. Paul's notes (<http://tutorial.math.lamar.edu/Classes/CalcIII/GreensTheorem.aspx>) solved a Green's problem with circular path, explaining that it was done in polar coordinates. That sounded good and I copied the method.

$$3. \mathbf{F} = \{x^2 e^y, y^2 e^x\}, \quad R \text{ the rectangle with vertices } \{0, 0\}, \{2, 0\}, \{2, 3\}, \{0, 3\}$$

```
Clear["Global`*"]
```

```
P[x_, y_] = x^2 e^y
```

```
Q[x_, y_] = y^2 e^x
```

```
e^y x^2
```

```
e^x y^2
```

```
D[P[x, y], x]
```

```
D[P[x, y], y]
```

```
D[Q[x, y], x]
```

```
D[Q[x, y], y]
```

```
2 e^y x
```

```
e^y x^2
```

```
e^x y^2
```

```
2 e^x y
```

I believe all of the above derivatives are continuous everywhere.

$$\int_0^2 \int_0^3 (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx$$

$$-\frac{19}{3} + 9e^2 - \frac{8e^3}{3}$$

The above answer matches the text. Limits of integration were not a problem.

$$5. \quad F = \{x^2 + y^2, x^2 - y^2\}, \quad R : 1 \leq y \leq 2 - x^2$$

```
Clear["Global`*"]
```

```
P[x_, y_] = x^2 + y^2
```

```
Q[x_, y_] = x^2 - y^2
```

```
x^2 + y^2
```

```
x^2 - y^2
```

```
D[P[x, y], x]
```

```
D[P[x, y], y]
```

```
D[Q[x, y], x]
```

```
D[Q[x, y], y]
```

```
2 x
```

```
2 y
```

```
2 x
```

```
-2 y
```

The above derivatives are continuous.

$$\int_{-1}^1 \int_1^{2-x^2} (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx$$

$$-\frac{56}{15}$$

The above answer matches the second part of the problem's answer.

$$\iint (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx$$

$$x(x-y)y$$

The first part of the problem is not solved here. I can't see a limit to the boundary on x , but using infinity does not work either.

7. $F = \text{grad}[x^3 \cos[xy]^2, R \text{ as in problem 5}]$

```
Clear["Global`*"]
```

```
f[x_, y_] = x^3 Cos[x y]^2
```

```
whatIsIt = Grad[f[x, y], {x, y}]
```

```
x^3 Cos[x y]^2
```

```
{3 x^2 Cos[x y]^2 - 2 x^3 y Cos[x y] Sin[x y], -2 x^4 Cos[x y] Sin[x y]}
```

```
P[x_, y_] = 3 x^2 Cos[x y]^2 - 2 x^3 y Cos[x y] Sin[x y]
```

```
Q[x_, y_] = -2 x^4 Cos[x y] Sin[x y]
```

```
3 x^2 Cos[x y]^2 - 2 x^3 y Cos[x y] Sin[x y]
```

```
-2 x^4 Cos[x y] Sin[x y]
```

```
D[P[x, y], x]
```

```
D[P[x, y], y]
```

```
D[Q[x, y], x]
```

```
D[Q[x, y], y]
```

```
6 x Cos[x y]^2 - 2 x^3 y^2 Cos[x y]^2 - 12 x^2 y Cos[x y] Sin[x y] + 2 x^3 y^2 Sin[x y]^2
```

```
-2 x^4 y Cos[x y]^2 - 8 x^3 Cos[x y] Sin[x y] + 2 x^4 y Sin[x y]^2
```

```
-2 x^4 y Cos[x y]^2 - 8 x^3 Cos[x y] Sin[x y] + 2 x^4 y Sin[x y]^2
```

```
-2 x^5 Cos[x y]^2 + 2 x^5 Sin[x y]^2
```

As for the continuity of the four lines of expressions above, I think the polys have to be continuous.

As for the trig expressions, I know of no reason why they should not be continuous, so I assume that

they are.

$$\int_{-1}^1 \int_1^{2-x^2} (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx$$

0

The expression from the previous problem is brought down, since the y domain is the same for this problem as for the last. The zero answer matches the text for the part where x is given values between -1 and 1. Then the answer section asks 'Why'? Good question. I copied the format for doing Green's Function problems, that's why.

$$9. F = \{e^{y/x}, e^y \text{Log}[x] + 2x\}, R : 1 + x^4 \leq y \leq 2$$

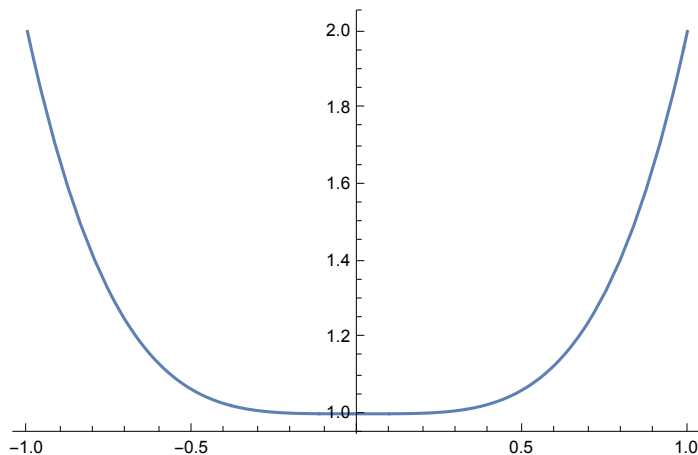

This problem is part of the set 1 - 10, so it is asking for the same thing as the others, do Green's theorem on a counterclockwise path. But it seems harder than the rest.

```
Clear["Global`*"]
```

```
quizz = 1 + x4
```

```
Plot[quizz, {x, -1, 1}]
```

```
1 + x4
```

```
P[x_, y_] = ey/x
```

```
Q[x_, y_] = ey Log[x] + 2 x
```

```
ey/x
```

```
2 x + ey Log[x]
```

```
Reduce[1 + x4 ≤ 2, x]
```

```
-1 ≤ x ≤ 1
```

$$-1 \leq x \leq 1$$

$$-1 \leq x \leq 1$$

$$D[P[x, y], x]$$

$$D[P[x, y], y]$$

$$D[Q[x, y], x]$$

$$D[Q[x, y], y]$$

$$-\frac{e^{\frac{y}{x}} y}{x^2}$$

$$\frac{e^{\frac{y}{x}}}{x}$$

$$2 + \frac{e^y}{x}$$

$$e^y \text{Log}[x]$$

For the first three of the above, x must not be zero in order for the expressions to be continuous inside the path. Outside of that, continuity does not seem to be an issue.

$$N[16 / 5]$$

3.2

$$\text{stet} = \int_{-1}^{-0.001} \int_{1+x^4}^1 (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx$$

$$\int_{-1}^{-0.001} \left(e^{\frac{1}{x}} (-1 + e^{x^3}) - \frac{e(-1 + e^{x^4})}{x} - 2x^4 \right) \, dx$$

$$\text{stetN2} = N \left[\int_{-1.293196}^{-0.001} \int_{1+x^4}^1 (D[Q[x, y], x] - D[P[x, y], y]) \, dy \, dx \right]$$

3.20008

There is a problem with finding the limits of integration for x. The y limits are not a problem. But x cannot be zero, though it can be anything above zero. Trying a few limit values, it seems possible to get close to the answer (yellows).

13 - 17 Integral of the normal derivative

Using (9), p. 437, find the value of $\int \frac{\partial w}{\partial n} \, ds$ taken counterclockwise over the boundary C of the region R.

13. $w = \text{Cosh}[x]$, R the triangle with vertices $\{0, 0\}$, $\{4, 2\}$, $\{0, 2\}$

`Clear["Global`*"]`

This problem is included in the s.m., p. 181. There it is represented that transforming the

normal derivative of a Laplacian of the cited function into a double integral is what needs to be done.

```
Laplacian[Cosh[x], {x}]
```

```
Cosh[x]
```

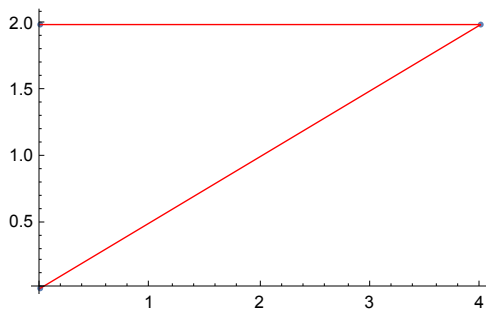

```
mypoints = {{0, 0}, {4, 2}, {0, 2}}
```

```
{{0, 0}, {4, 2}, {0, 2}}
```

```
a = ListPlot[mypoints, ImageSize → 250];
```

```
b = ListLinePlot[mypoints, PlotStyle → {Red, Thickness[0.003]}];
```

```
Show[a, b]
```

By inspection it is seen that, for the hypotenuse, $y = \frac{x}{2}$, or $x = 2y$. So the s.m. says that what is needed is a double integral with x going from 0 to $2y$ and y going from 0 to 2.

$$\text{blaso} = \int_0^2 \int_0^{2y} \text{Cosh}[x] \, dx \, dy$$

$$\frac{1}{2} (-1 + \text{Cosh}[4])$$

The above answer agrees with the text's.

$$15. \, w = e^x \cos[y] + x y^3, \, R : 1 \leq y \leq 10 - x^2, \, x \geq 0$$

```
Clear["Global`*"]
```

```
here = Laplacian[e^x Cos[y] + x y^3, {x, y}]
```

$$6 x y$$

The above agrees with the text's calculation of the Laplacian.

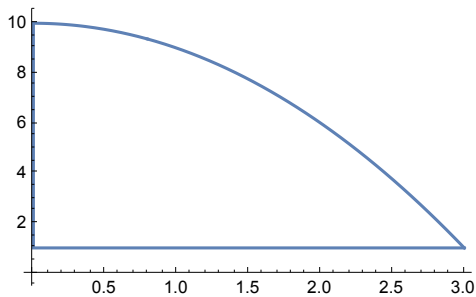

$$\text{Reduce}[1 \leq y \leq 10 - x^2 \, \&\& \, x \geq 0]$$

$$(0 \leq x < 3 \, \&\& \, 1 \leq y \leq 10 - x^2) \, || \, (x == 3 \, \&\& \, y == 1)$$

```

p1 = Plot[10 - x^2, {x, 0, 3}];
plist = {{0, 10}, {0, 1}, {3, 1}}
p2 = ListLinePlot[plist];
Show[p1, p2]
{{0, 10}, {0, 1}, {3, 1}}

```

Above is the path. Now to write an integral with limits that walk around it ccw.

$$\text{blastiddo} = \int_0^3 \int_1^{10-x^2} 6xy \, dy \, dx$$

486

The above answer matches the text's. It seemed appropriate to make dy the inner integral.

$$17. w = x^3 - y^3, \quad 0 \leq y \leq x^2, \quad |x| \leq 2$$

```
Clear["Global`*"]
```

```
Lap = Laplacian[x^3 - y^3, {x, y}]
```

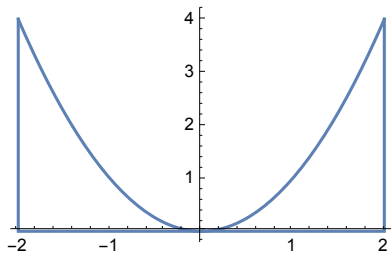

6 x - 6 y

The above agrees with the text's calculation of the Laplacian.

```

p1 = Plot[x^2, {x, -2, 2}, ImageSize -> 200];
plist = {{0, 0}, {2, 0}, {2, 4}}
p2 = ListLinePlot[plist, ImageSize -> 200];
p2list = {{-2, 4}, {-2, 0}, {0, 0}}
p3 = ListLinePlot[p2list, ImageSize -> 200];
Show[p1, p2, p3]
{{0, 0}, {2, 0}, {2, 4}}
{{-2, 4}, {-2, 0}, {0, 0}}

```

Above is the path. Now to write an integral with appropriate limits of integration.

$$\text{blastiddo} = \int_{-2}^2 \int_0^{x^2} (6x - 6y) \, dy \, dx$$

$$-\frac{192}{5}$$

$$\frac{-192.}{5}$$

$$-38.4$$

The above answer agrees with the text's. Again I elected to put dy on the inside.

19. Show that $w = e^x \sin[y]$ satisfies Laplace's equation $\nabla w = 0$ and, using numbered line (12), p. 438, integrate $w(\frac{dw}{dn})$ counterclockwise around the boundary curve C of the rectangle $0 \leq x \leq 2$, $0 \leq y \leq 5$

```

Clear["Global`*"]
eq[x_, y_] = e^x Sin[y]
e^x Sin[y]

Lap = Laplacian[e^x Sin[y], {x, y}]
0

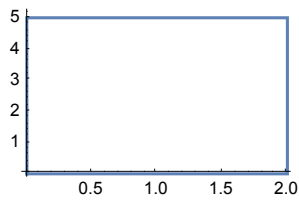

ppoints = {{0, 0}, {2, 0}, {2, 5}, {0, 5}, {0.001, 0}}

{{0, 0}, {2, 0}, {2, 5}, {0, 5}, {0.001, 0}}

```

```
ListLinePlot[ppoints, ImageSize -> 150]
```

The problem instructions refer to numbered line (12), an equation contained in the problems, and shown below.

$$(12) \quad \iint_R \left(\frac{dw}{dx} \right)^2 + \left(\frac{dw}{dy} \right)^2 dx dy = \oint_C w \frac{dw}{dn} ds$$

The partial derivatives in the top line, for the present problem, are the raps:

```
rap1 = D[e^x Sin[y], x]
```

```
e^x Sin[y]
```

```
rap2 = D[e^x Sin[y], y]
```

```
e^x Cos[y]
```

```
sq = rap1^2 + rap2^2
```

```
e^2 x Cos[y]^2 + e^2 x Sin[y]^2
```

```
sq1 = TrigReduce[sq]
```

```
e^2 x
```

And the top line filled in and executed:

$$\text{outsq} = \int_0^5 \int_0^2 (\text{sq1}) dx dy$$

$$\frac{5}{2} (-1 + e^4)$$

The line above agrees with the text's answer.
